Amendments to the Claims:

This listing of claims replaces all prior versions and listings of claims in the application:

Listing of Claims:

1. (Currently Amended) A system, comprising:

a plurality of collector devices that are disposed to collect connection information to identify host connection pairs from packets that are sent between nodes on a network; and

an aggregator device that receives the connection information from the plurality of collector devices, and which produces a connection table that maps each node on the network to a record that stores information about packet traffic to or from the node, with the aggregator device further comprising:

<u>a process executed on the aggregator device to detect anomalies in connection</u> <u>patterns; and</u>

a process executed on the aggregator device to aggregate detected anomalies into the network events with the anomalies that are detected including denial of service attack anomalies and scanning attack anomalies.

- 2. (Previously Presented) The system of claim 1 wherein the aggregator determines at least in part from connection patterns derived from the connection table occurrences of network events that indicate potential network intrusions.
- 3. (Previously Presented) The system of claim 2 wherein the aggregator further comprises:

a process that collects statistical information on packets that are sent between nodes on a network and which sends the statistical information to the aggregator.

Claim 4 is canceled.

5. (Currently amended) The system of claim 1 wherein the collector[[s]] devices have a passive link to devices in the network.

Claim 6 is canceled.

- 7. (Currently Amended) The system of claim 1 [[4]] wherein the anomalies include unauthorized access and worm propagation.
- 8. (Original) The system of claim 1 wherein the connection table includes a plurality of records that are indexed by source address.
- 9. (Original) The system of claim 1 wherein the connection table includes a plurality of records that are indexed by destination address.
- 10. (Original) The system of claim 1 wherein the connection table includes a plurality of records that are indexed by time.
- 11. (Original) The system of claim 1 wherein the connection table includes a plurality of records that are indexed by source address, destination address and time.
- 12. (Original) The system of claim 1 wherein the connection table includes a plurality of connection sub-tables to track data at different time scales.
- 13. (Previously Presented) The system of claim 12 wherein the connection sub-tables include a time-slice connection table that operates on a small unit of time and at least one other sub-table that operates on a larger unit of time than the time slice sub-table with each sub-table holding the sum of records received from all collectors during respective units of time.

14. (Currently Amended) A method, comprises:

sending connection information to an aggregator to identify host connection pairs collected from a plurality of collector devices to an aggregator; and

producing in the aggregator a connection table that maps each node on the network to a record that stores information about traffic to or from the node, with the connection table including a plurality of entries that are indexed by source address.

- 15. (Previously Presented) The method of claim 14 further comprising: collecting statistical information in the collector devices to send to the aggregator device.
- 16. (Currently Amended) The method of claim 15 further comprises:

determining from the connection information and the statistical information occurrences of network anomalies; and

aggregating anomalies into network events that indicate potential network intrusions and communicating occurrences of network events to an operator.

Claim 17 is canceled.

- 18. (Original) The method of claim 14 wherein the connection table includes a plurality of entries that are indexed by destination address.
- 19. (Original) The method of claim 14 wherein the connection table includes a plurality of records that are indexed by time.
- 20. (Original) The method of claim 14 wherein the connection table includes a plurality of records that are indexed by source address, destination address and time.

21. (Original) The method of claim 14 wherein the connection table includes a plurality of connection sub-tables to track data at different time scales.

22. (Previously Presented) The method of claim 21 wherein the connection sub-tables include a time-slice connection table that operates on a small unit of time and at least one other sub-table that operates on a larger unit of time than the time slice sub-table with each sub-table holding the sum of records received from all collectors during respective units of time.

23. (Original) A method of detecting a new host connecting to a network comprises: receiving statistics collected from a host in the network; and

indicating to a console that the host is a new host if, during a period of time T, the host transmits at least N packets and receives at least N packets, and if the host had never transmitted and received more than N packets in any previous period of time with a duration of T.

24. (Previously Presented) A method executed in a computing device for detecting a failed host in a network comprises:

determining in the computing device, if both a mean historical rate of server response packets from a host is greater than M and a ratio of a standard deviation of historical rate of server response packets from the host to a mean profiled rate of server response packets from the host is less than R over a period of time; and

indicating the host as a potential failed host if both conditions are present.

25. (New) The method of claim 23 wherein indicating comprises:

determining the minimal rate of N/T packets/second to avoid false positives caused by scans or spoofing attacks.

26. (New) The method of claim 24 wherein indicating comprises:

determining a period seconds of continuous inactivity of the potential failed host to expire the potential failed host after the period of continuous inactivity; and

generating a new host event if the expired failed host sends traffic on the network after the period of continuous inactivity has elapsed.

27. (New) The method of claim 24 wherein a host failure indicates an inability by the host to generate traffic on the network or an application failure.
